Pept. 83:1-10(1999).

FUNCTION: Stimulates prolactin (PRL) release and regulates expression of prolactin through its receptor GPR10. May stillactotrophs directly to secrete PRL.

TISSUE SPECIFICITY: Widely expressed, with highest levels 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    N
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             medulla oblongata and hypothalamus.

J. HOL. BLOL. 148:303-330(1981).

J. FUNCTION: ENDODEOXYRIBONUCLEASE I, WHICH IS EXPRESSED IN THE LATE STAGE, IS RECESSARY FOR T7 GENETIC RECOMBINATION AND THE BREAKDOWN OF NOST DNA. IN THE EARLY STAGE OF INFECTION, T7 DNA REPLICATES AS A LINEAR MONOMER. 1N THE LATE STAGE, THE T7 DNA REPLICATES YIA LINEAR CONCATEMERS SEVERAL GENOMES IN LENGTN. THE GENE 3 PRODUCT NAS ALSO BEEN IMPLICATED IN THE MATURATION OF THESE CONCATEMERS.

-I- CATALYTIC ACTIVITY: Endonucleolytic cleavage to 5'-
phosphooligonuclectide end-products.

Pharmaceutical compositions containing this ligand may be used as a pituitary function CC modulator, a central nervous system modulator or a pancreatic function CC modulator. This ligand could have specific applications as a complyiactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC trauma, growth hormone secretory disease, hyper- and polyphagia, CC hyperlipidaemia, hypercholesteroidemia, hyperglyceridaemia, hypercholesteroidemia, hyperglyceridaemia, hyperpolactinemia, diabetes, cancer, pancreatitis, renal disease, hyperprolactinemia, diabetes, cancer, pancreatitis, renal disease, transient brain ischaemia, estime, rheumatoid arthritis, spinal injury, CC transient brain ischaemia, estime, amylotrophic lateral sclerosis, concer pancer pancreation, concerned myocardial infarction, infertility, spinocerebellar degeneration, conference myocardial infarction, infertility, osteoporosis and/or collogogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting cCC activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a human type ligand fragment. It
is used in the course of the invention. The specification describes
an agent for modulating prolactin secretion which comprises a
ligand polypeptide or a sait, for a 6 protein coupled receptor (GPCR)
protein. The agents for promoting prolactin secretion can be used for
treating or preventing hypocovarianism. They can by used for promoting
syndrome, euthyroid or hypometabolism. They can by used for promoting
lactation in a domestic mammal and as an aphrodisiac. The agents for
inhibiting prolactin secretion can be used for treating or preventing
plutitary adenomatosis, brain tumour, emmeniopathy, autoimmune disease,
prolactinoma, infertility, impotence, amenorrhea, galactorrhea,
acromegaly, Chiari-Frommel syndrome, Argonz-del Castilo syndrome,
forbes-Albright syndrome, lymphoma, Sheehan syndrome or dyszoospermia.
The inhibitory agents can also be used for treating or preventing
chorres acromedaling hydatid mode, irruption mode, abortion, unthrifty fetus,
shours lacecharametabolism abortion mode, abortion, unthrifty fetus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion
The invention provides a monoclonal antibody which has a specific reaction with the part peptide of the C-terminal of 1982 11gand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of prolactin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunosassy can also be applied in clarifying the physiological functions of the ligand and its derivative sequences ANY49290-302 represent peptide fragments of the 1992 ligand.
                                                                                                                                                                                                                                                          Disclosure; Page 26; 73pp; Japanese.

                                                                                                                       The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G protein receptor ligand. This can be used to control the secretion of CRH and is useful as an analysis or for trasting, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, Addison's disease (including boredom, nauses, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The present sequence is a peptide used in the exemplification of the

                                                                                                                                                                                                                                                         The present invention describes a modified therapeutic poptide (I) comprising a therapeutically active amino acid region (III) and a creactive group (II) (e.g. succinimidy) and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyi/thiol groups on blood components to form a peptidnss stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases and specificity as bonding to large molecules decreases. AAB90829 to AAB92441 represent peptides which can be used in the examplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      17-MAY-1999;

                                                                                                                                                                                                                                                                      This sequence represents a peptide fragment from a novel human type CC ligand polypeptide corresponding to amino acid residues 34 to 54 of the CC sequence represented in AAW31390 and is used in an assay to monitor CC ligand binding to the G protein-coupled receptor protein. Pharmaceutical CC compositions containing this ligand may be used as a pituitary function CC modulator, a central nervous system modulator or a pancreatic function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC hyperiipidaemia, hypercholesterolesmia, hypergiyceridaemia, hypercholesterolesmia, hypergiyceridaemia, for the sectory disease, hyper- and polyphagia, CC hyperipidaemia, diabetes, cancer, pancreatitis, renal disease, CC Turner's syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, CC translant braia ischaemia, epilepsy, amylotrophic lateral sclerosis, CC acute myocardial infarction, infertility, spinocerebellar degeneration, CC conselatoria, Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting CC activation of the G protein-coupled receptor protein.

It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placents, uterine recovery failure, caesarcan section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin aecretion
                                                              Human; corticotrophin releasing hormone; CRH; G protein receptor ligand analgesic; hyperaldosteronism; hypercortisolsemia; hypoadrenocorticism; Addison's disease; adrenal gland hyperfunction; obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Physiologically-active polypeptide recognized as ligand by G protein-coupled receptor protein, for promoting aecretion of oxytocin, as drugs for diaeaaes relating to oxytocin secretion and in veterinary

This can be used to control the secretion of CRH and is useful as an analgesic or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, hair alsease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The present sequence is a peptide used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ດ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (TAKE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cc ligand polypeptide corresponding to amino acid residues 34 to 55 of the csequence represented in AAW31390 and is used in an assay to monitor cligand binding to the G protein coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitsry function modulator, a central nervous system modulator or a psncreatic function modulator. This ligand could have specific applications as a syndrome, containing this specific applications as a syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, crawing growth hormone secretory disease, hyper-and polyphsgia, crawing growth hormone secretory disease, hyper-and polyphsgia, crawing growth hormone secretory disease, hyper-and polyphsgia, crawing syndrome, neurosis, asthms, rhemmatoid arthritis, spinal injury, crassiant brain ischaemia, spilapsy, amylotrophic lateral sclerosis, active myocardial infarction, infertility, spinocerebellar degeneration, bone fracture, trauma, atopic demustitis, osteoporosis snd/or coligogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ouery Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel oxytocin secretion-regulating sgent which contains a ligand peptide or its salt for the G protein-coupled receptor protein. It is useful in the form of drugs for smellorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and sfter expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostssis and is also sppiicsble in veterinsry medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion
          corticotrophin relessing hormone (CRH), invoiving the use of a G prot receptor ligand. This can be used to control the secretion of CRH and useful as an snaigesic or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, Addisor disease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrensi gland hypofunction and obesity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
This sequence represents a peptide fragment from a novel human type CC ligand polypeptide corresponding to amino acid residues 23 to 53 of the Sequence represented in AAW31390 and is used in an assay to monitor CC ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function CC modulator. This ligand could have specific applications as a modulator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic Syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth bormone secretory disease, hyper- and polyphagia, CC hyperlipidaemia, hypercholesterolaemia, hyperglyceridaemia, hyperpolactinaemia, diabetes, cancer, pancrestitis, renai disease, CC Turner's syndrome, neurosis, asthma, rheumatoid arthritis, spinai injury, translent brain lschaemia, spihepsy, amylotrophic lateral sclerosis, acute myocardial infarction, infertility, spinocerebeilar degeneration, CC bone fracture, traums, atopic dermatitis, osteoprosis and/or colloqualectia. Assays can also be developed to screen compounds which are CC capable of altering the binding activity of the ligand affecting CC activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SX
           The present sequence represents a human type ligand fragment. It

CC is used in the course of the invention. The specification describes

cC an agent for modulating prolactin secretion which comprises a

CC ligand polypeptide or a salt, for a G protein-coupied receptor (GPCR)

CC protein. The agenta for promoting prolactin secretion can be used for

CC treating or preventing hypocvarianism, genecyat cacogenesis, menopausal

CC syndrome, euchyroid or hypometabolism. They can by used for promoting

CC lactation in a domestic mammal and as an aphrodisiac. The agents for

CC inhibiting prolactin secretion can be used for treating or preventing

CC pituitary adenomatosis, brain tumour, emmenlopathy, autoimmune disease,

CC prolactinoma, infertility, impotence, amenoribea, galactorrhea,

CC prolactinoma, chiarl-Frommel syndrome, Argonz-dei Castilo syndrome,

CC prolactinoma syndrome, lymphoma, Sheehan syndrome or dyszoospermia.

CC represe-Albright syndrome, lymphoma, Sheehan syndrome or dyszoospermia.

CC modulating placental function can be used for treating or preventing

CC choriocarcinoma, hydatid mode, irruption mode, abortion, unthrifty fetus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Rat type ligand; modulation; projectin accretion; gonecyst cacogenesia; gonecyst-cacogenesia; gonecyst-cacogenesia; menopausal syndrome; euthyrold; hypometabolism; lactation; pituitary adenomatosis; brain tumour; emmenlopathy; autoimmune disease; projectinome; infertifity; impotence; amenorrhea; galactorrhea; acromegaly; Chiari-Frommel syndrome; Argonz-del Castilo syndrome; rorbes-Albright syndrome; lymphoma; Sheehan syndrome; dyszoospermia; contraceptive; placental function; choriocarcinoma; hydatid mode; truption mole; abortion; unthrifty fetus; abortmai aaccharometabolism;

QX
CC This is the amino acid sequence of the human pituitary G
CC protein-coupled receptor ligand 1921. A method suitable for
CC commercial high-level production of 1921 comprises expressing
CC the ligand in host cells as a recombinant fusion protein e.g. with
CC human basic fibroblast growth factor (see AAV83796-97) that has
CC been modified to include an N-terminal cysteine residue. The
CC ligand is released from the fusion by cyanylation followed by
CC ammonolysis. 1992 has prolactin secretion-stimulating and (at
CC high doses) prolactin secretion-inhibiting properties. It can be
CC used in the treatment and prevention of various diseases including:
CC with: genealogical disorders (e.g. Alzhamer's disease, Parkinson's
CC disease, Pick's disease, Huntington's disease, infectious diseases
CC (e.g. Creutzfeidt-Jakob's), endocrine or metabolic disease or
CC toxicosis (o.g. hypothyroidism, vitamin 812 deficiency, alcoholism,
CC diseases (e.g. brain tumour), traumatic diseases (e.g. chronic
CC diseases (e.g. brain tumour), traumatic diseases (e.g. chronic
CC subarachnoidal heamorrhage, and other types of dementia, depression,
CC diseases associated with prolactin hypo and hypersecretion
CC consciousness, It is also useful for prevention and treatment of
CC consciousness, infertility, impotence and autoimmune disease
CC (hypersective ty, including; hyperprolactineemia, pituitary adenoma,
CC breast cancer, infertility, impotence and autoimmune disease
CC (hypersectively, including; hyperprolactineemia, pituitary adenoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
